Snapshot 2 – Checkpoint 1 Objective

For Snapshot 2, our goal was to begin implementing the first large feature of SportHub: viewing games by sport and date.

Completed Work

- Implemented a basic **All Games** frontend page that lists games with sport, teams, date, and time using mock data in JavaScript (`frontend/index.html` and `frontend/script.js`).

- Added simple filters for sport (All, NBA, NFL, MLB) so users can limit the list to a single sport.

- Updated the SDD, SRS, user manual, and design spec to describe the current All Games feature and the overall architecture.

Next Steps

- Create a backend endpoint (with mock data or a simple database table) to return a list of games for the All Games page.

- Extend the frontend to load games from the backend API instead of using only local mock data.

- Set up TestRail and create test cases for listing and filtering games.

- Update the workflow diagram to show the full flow for viewing games (User → Frontend → Backend → Database).
